

Multi-State University Collaboration Opportunities

Bob Steele, PhD

Dean, College of Agricultural Sciences

Penn State University

April 28, 2009

There is progress, but more can be done

- Let the “issue” be the “driver”
- Invest in base capacity
- Identify the expertise, regardless of location
- Design the program to be compelling (\$\$ and time) to the expertise
- Assure accountability, but “stay out of the way”

What is Johne's Disease?

- JD is a chronic infectious disease of dairy cattle and other animal species caused by *Mycobacterium paratuberculosis*
 - Infected cows exhibit chronic diarrhea, weight loss, decreased milk production - and ultimately die as a result of infection
 - JD is present worldwide
 - infection rates in many countries approach 50% - increasing incidence
 - Annual economic losses exceed \$1 billion

More about Johne's disease

- No treatment, no good vaccines, current diagnostic tests are not very good, methods of control are unclear, the bacterium is shed in milk and survives pasteurization, possible link with Crohn's disease in humans
- In 2004 the USDA-CSREES funded (\$4.4m) the creation JDIP, a multi-state Coordinated Agricultural Project for Johne's disease research, JDIP was renewed in 2008 (\$4.8m) with Penn State as the lead institution

What is JDIP?

A multistate consortium whose mission is to promote animal biosecurity through development and support of projects that enhance knowledge, promote education, develop real-world solutions and mitigate losses from Johne's Disease.

More about JDIP

- Consortium of > 150 scientists from > 30 academic institutes, government agencies, and industry
 - Expanding membership
 - Establishing strong international collaborations
 - A similar European program was established in June of 2006
 - Strong links with industry

The Missing Bees

- Colony Collapse Disorder
 - First noted in the winter of 2006-2007
 - Uncharacteristic loss of adult honey bees from the hive
 - Many possible causes
 - Pesticide exposure
 - Nutritional stress
 - Diseases

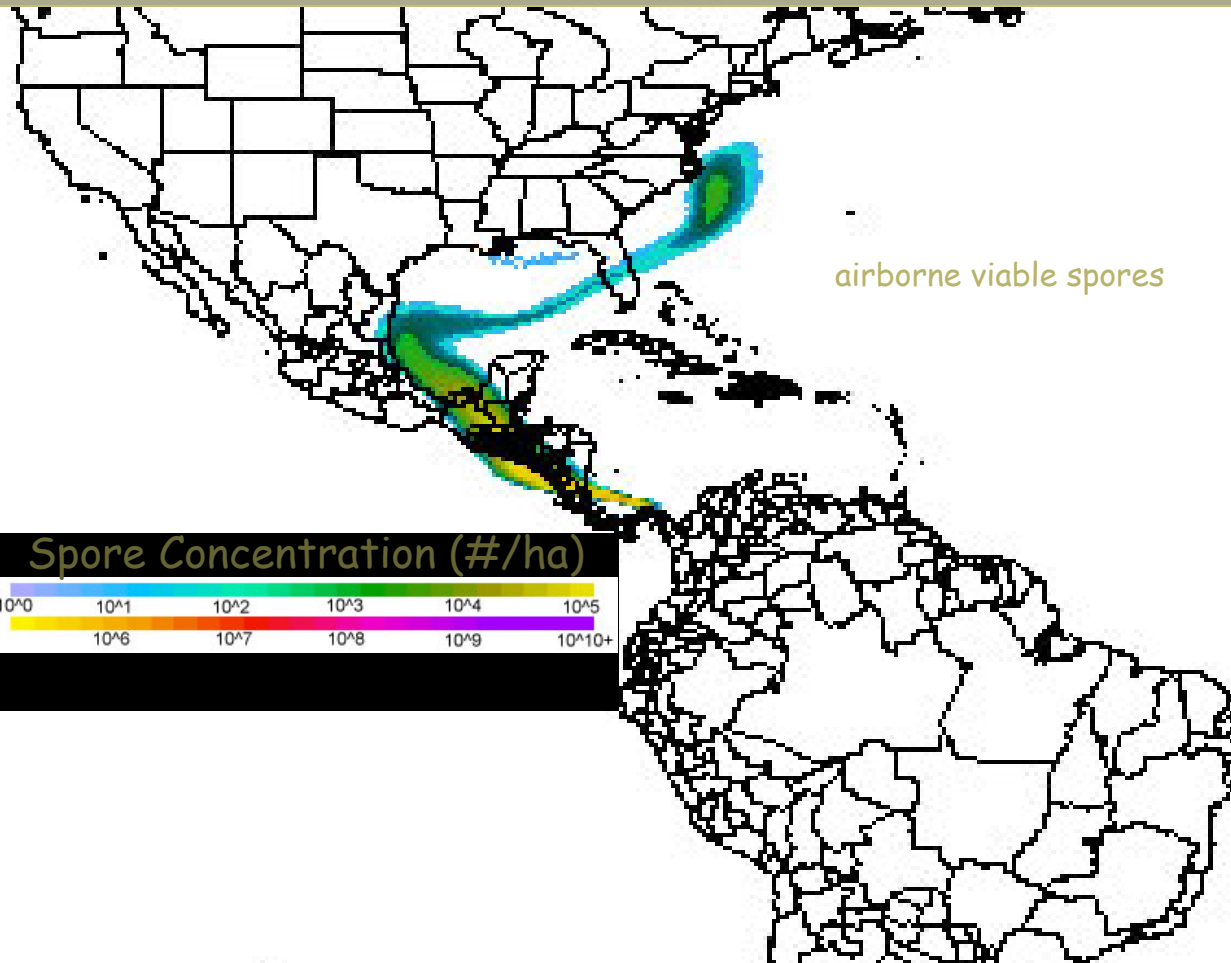

ZedX, Inc.

Aerobiological Risk Analysis for Soybean Rust

A project funded by APHIS to examine the risk of the aerial incursion of soybean rust into North America.

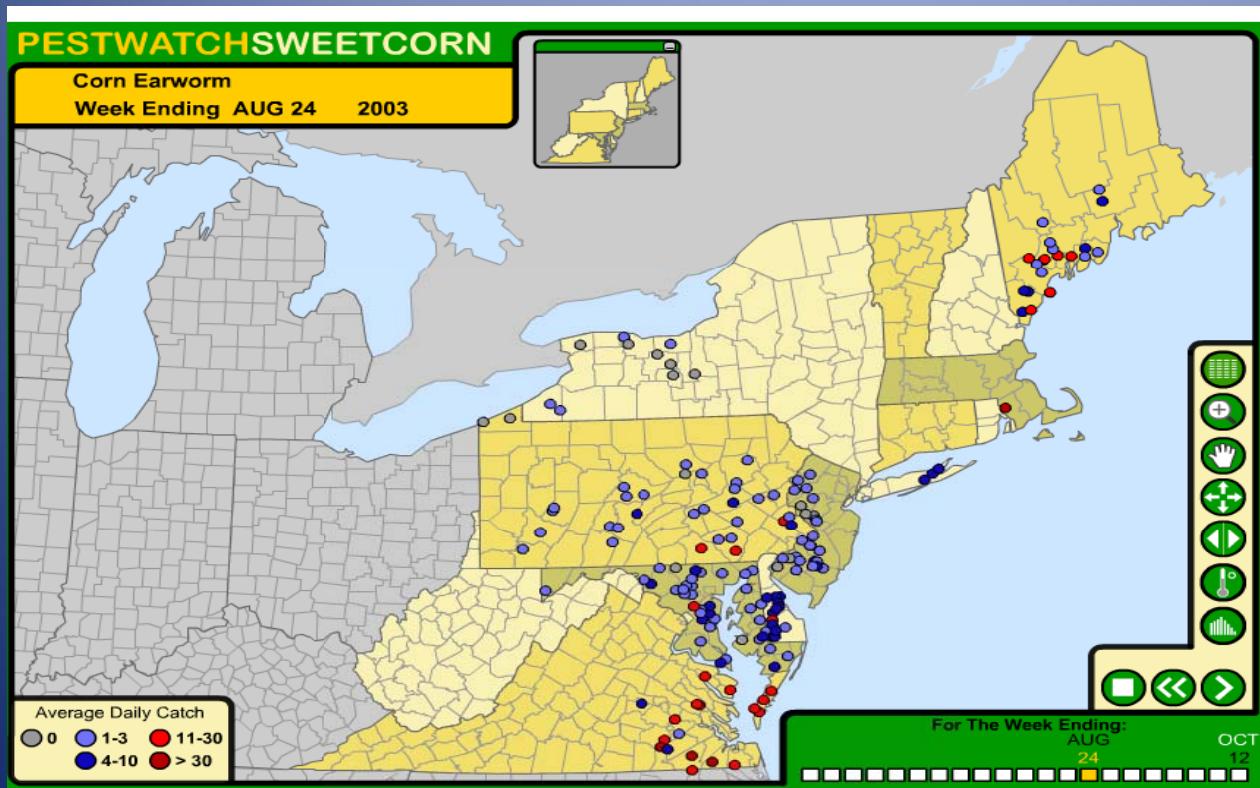

NC STATE UNIVERSITY

Biosensors: Learning from Nature

Using simple atmospheric models to track corn pests

Biosensors: Learning from Nature

Heliothis virescens male

Biosensors: Learning from Nature

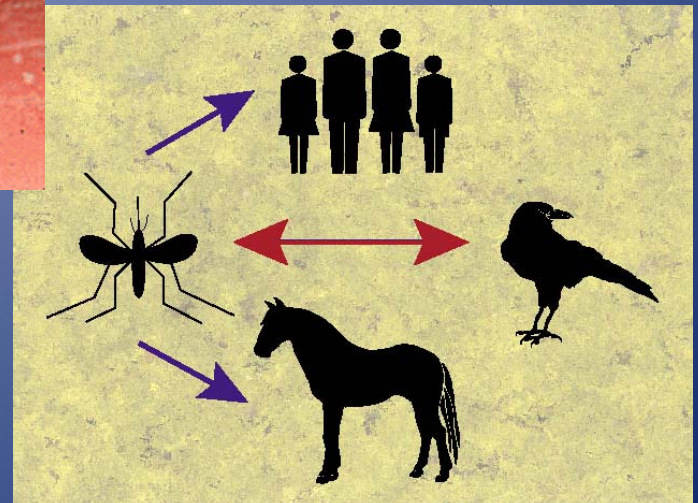

Guarding against Food-borne Disease

Food safety is a continuing research emphasis (HACCP)

Guarding against Human Disease

West Nile Virus

Guarding against Animal Diseases

- A variety of animal diseases have been in the news recently
 - Recognition
 - Diagnosis
 - Response
 - Control
 - Prevention

Guarding against Plant Pests

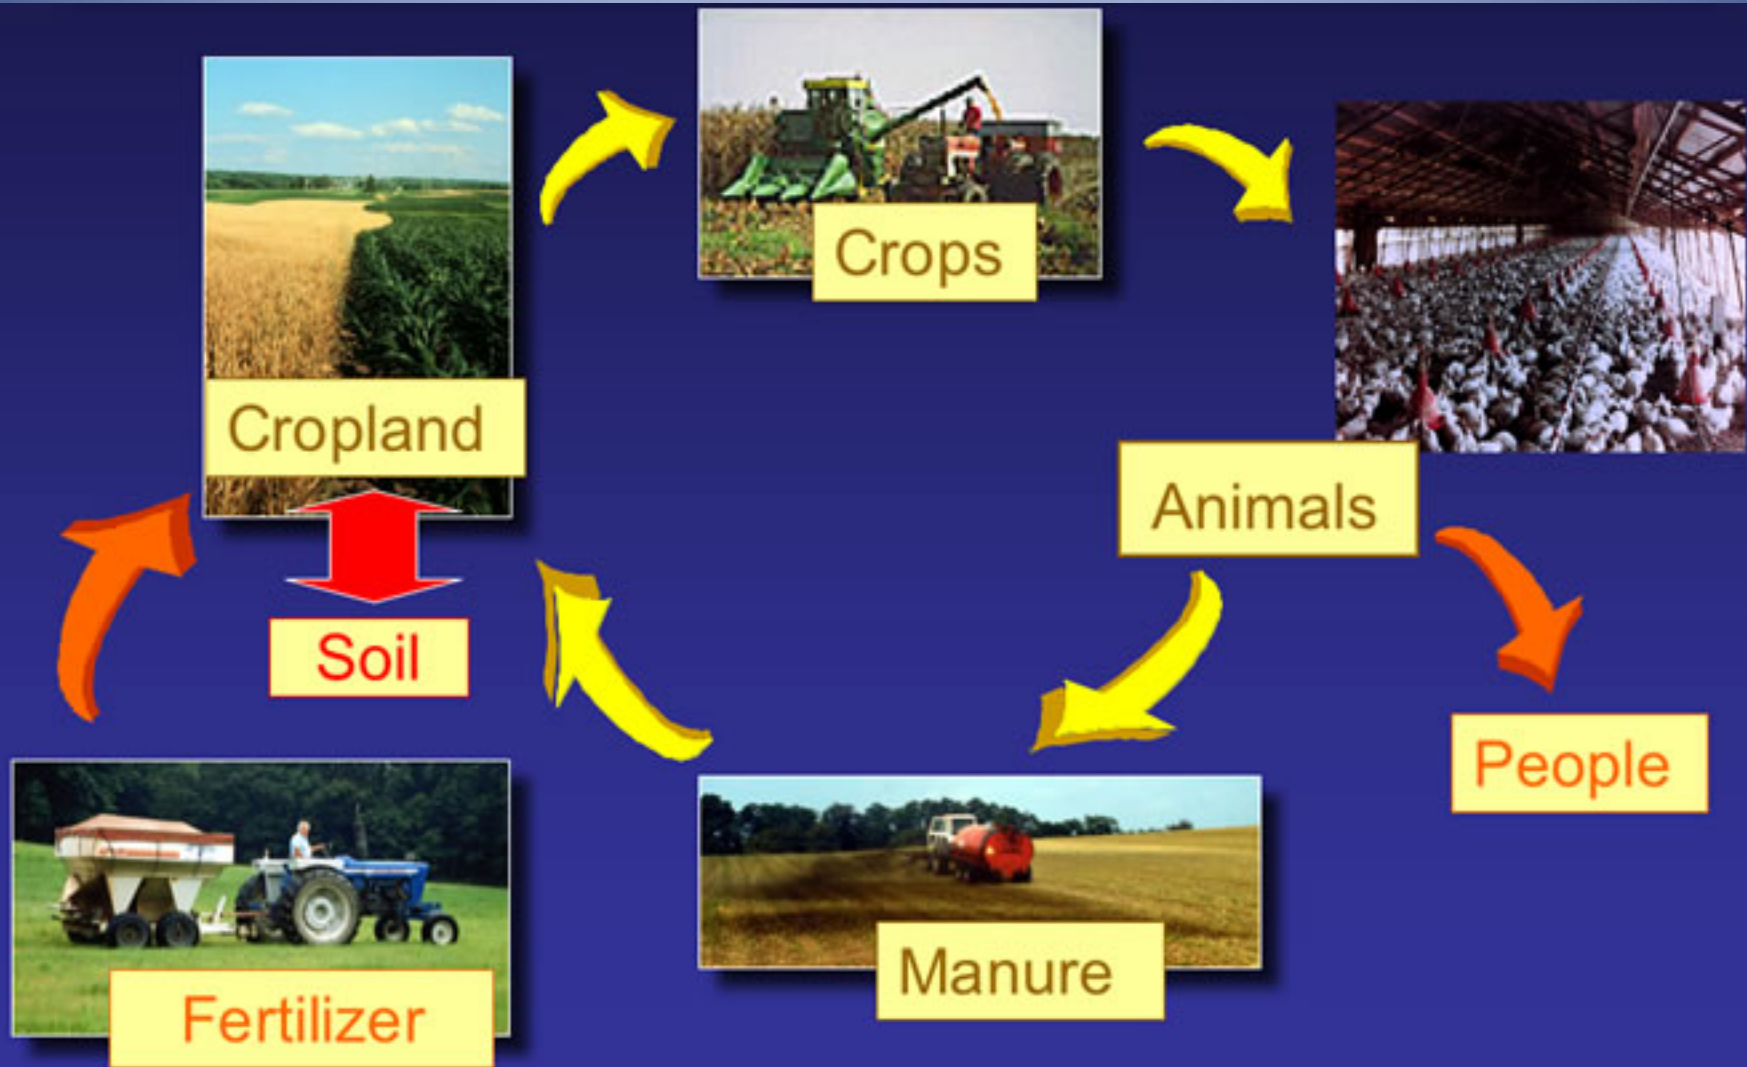

- Non-disease pests can threaten agriculture

Asian long-horned beetle

Phosphorus Cycle

Biomass to Bioenergy

Switchgrass
